

A city in face of coastal erosion

Several streets have disappeared during the last century

Civil engineering works to manage erosion

Throughout its history, the town council has used civil engineering works to manage erosion. The "casquette" is an example of this: a sort of concrete balcony, in the continuity of the cliff.

SOLIDarity in climate change Adaptation policies: towards more socio-spatial justice in the face of multiple RISks

A Multi-disciplinary research

8 cases studies, 4 countries : Belgium, England, Finland, France.

HYPOTHESIS

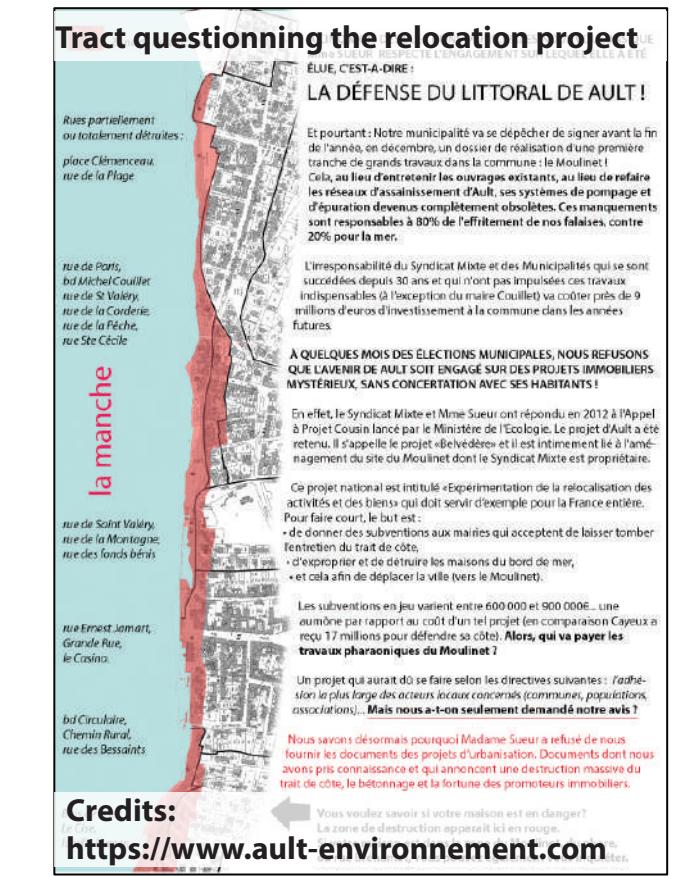

Existing social and spatial inequalities threaten the implementation of climate change adaptation policies (CCAP) and the equitable involvement of affected citizens.

ARE WITHDRAWAL STRATEGIES AN OPTION?

Lessons from the case of Ault (France)

The withdrawal strategy...

In 2012, the commune of Ault is selected at national level for an experiment seeking to encourage **withdrawal strategies to manage coastal erosion in France**. Local authorities could benefit from a determined area to plan relocation of inhabitants and activities: the "ZAC du Moulinet", property of the *Syndicat Mixte Baie de Somme - Grand littoral Picard*, inter-municipal actor in charge of planning at the scale of the bay of Somme.

The so-called "revitalisation" project plans the withdrawal strategy for the longer term.

The project generated a great **conflict between local stakeholders**.

Thus, today, it is no longer presented as a «relocation» project, but rather as an revitalisation project. Several actions are also deployed to reduce erosion. It is possible to mention:

- waterproofing** of public spaces,
- adaptation of **sewage networks**,
- soft water works** in agricultural fields to reduce run-off.

...and its debates

Citizens mobilisation against the Moulinet project questions the delocation strategy, and more precisely:

- Its lack of **transparency**. Citizens learned about the project on the media.
- Choosing not to finance the **civil engineering infrastructures**.

Their modes of action include: public meetings, leaflets, t-shirts, sound trail along the coastline, exhibitions.

The mobilisation produced knowledge based on expert reports, not calling into question the risk of erosion. In their productions, citizens articulate expert knowledge to knowledge in history, in heritage, folk knowledge (from fishers), art. The objective is to present the cliff not only through the question of risk. This enlargement of the debate answers to an objective of its democratisation

We wanted to retrace the whole history of the constitution of the cliff, of the sea level which descends and rises [...] to say to ourselves: let's understand the evolution of the history of this place to take part in the debate which, we hope, will take place in a democratic way in the future...[Ault, 04/2022].

The project provides learning on:

- The challenges of **involving citizens** in adaptation measures.
- It also sheds light on the **social challenges** raised by adaptation measures as radical as relocation.
- It also provides learning on **how to communicate expertise**.

3 RESEARCH QUESTIONS

- 1) How and when are issues of equality and justice addressed in FRM and CCAP?
- 2) What participation procedures are in place (legal obligations, legal framework)?
- 3) What types of knowledge about risk, equality and justice are available and used?
